Understand your air. Build your own air purifier. Learn
simple ways to protect yourself from air pollution.

Community Driven Air Quality, Heat, and Humidity Reduction Project

Reducing Environmental Burdens

● Project Summary

We're working to understand and improve indoor air quality across Philadelphia neighborhoods by creating easy-to-understand local air quality maps. We'll also provide air purifiers and simple, practical guidance to help residents protect themselves and their families at home.

● Key Goals

- A. Sensor monitoring from Spring 2026 to Winter 2027
- B. Distribution of DIY air cleaners (CR boxes) + behavioral guidance
- C. Community guidance system using SMS notifications

● Community Driven

We are working with community based organizations and block captains for the outreach of this project. We are also looking for youth in these areas to become Air Stewards to learn and assist with air sensor installation and community engagement

● Target Audience

We are looking for residents in the Haddington, Kingsessing, Point Breeze, and Gray's Ferry neighborhoods primarily

● Pollutants

Fine particulate matter (PM2.5) which are small particles that can be inhaled deeply and can cause short term and long term health impacts

● Household Recruitment

- A. Engage and community with Drexel staff + local organizations
- B. Answer household questions including indoor pollution sources and features (HVAC, pets, gas/electric stove, etc)
- C. Let us install the sensor in your living room (needs \$1/year power, NO WIFI)
- D. Build and run a DIY portable air cleaner in your home (you get to keep it!)
- E. Receive SMS alerts once or twice a week with exposure reduction tips (can opt out)
